21 March 2026

Introduction

This report presents the results of a vulnerability assessment conducted on the target website.
The objective of this assessment is too identify potential security weaknesses and provide recommendations to improve the security posture of the system.

Methodology

The following tools and techniques were used during the assessment:
-Nmap for network scanning
-OWASP ZAP for passive vulnerability scanning
-Browser Developer Tools for manual inspection

The scan was conducted in a controlled and ethical environment using publicly available test targets.

Finding 1:Missing Content Security Policy

-Description: The application does not define a Content Security Policy header.

-Risk Level: Medium

-Impact: This may allow attackers to execute malicious scripts (XSS attacks).

-Recommendation: Implement a strong Content Security Policy to restrict content sources.

Finding 2: Missing Anti-clickjacking

-Description: The X-Frame-Options header is not set.

-Risk Level: Medium

Finding 3: Missing Anti-CSRF Tokens
Description: Forms do not contain anti-CSRF tokens.
-Risk Level: Medium
-Impact: Attackers could perform unauthorized actions on behalf of users.
-Recommendation: Implement CSRF tokens in all forms.
Finding 4: Server Information Disclosure
-Description: The server reveals version information via HTTP headers.
-Risk Level: Low
Impact: Attackers can gather information about the server.
-Recommendation: Hide or remove server version details.
Finding 5: Missing Security Headers
Description: Important security headers are missing.
Risk Level: Low
Impact: Reduced protection against common attacks.
Recommendation: Add headers like:
-X-Content-Type-Options
-X-XSS-Protection
-Strict-Transport-Security.

Summary Table

Vulnerability	Risk	Ststus
Missing CSP	Medium	Found
Clickjacking	Medium	Found
CSRF	Medium	Found
Info Disclosure	Low	Found
Missing Headers	Low	Found

Evidence

-Capture de ZAP
-Capture de scan nmap (les ports ouverts expose des services)

Conclusion

The assessment identified several security weaknesses,mainly related to missing security headers and improper configurations.
Although no critical vulnerabilities were detected ,these issues could increase the attack surface of the application.
It is recommended to implement proper security controls to enhance the overall security posture.
